

Final Statistics Presentation

Mr. Grant

July 31, 2017

Due Date: Wednesday or Thursday (depending on your group) August 2nd or 3rd

You must give a final presentation on the survey/study you conducted last Friday. Each group's presentation should be around 8 minutes (a minute or two over or under is okay). That means each person in the group should talk for about 2 minutes.

The point of this presentation is to describe your study and the conclusions you've drawn from the data you gathered *to your peers* (your peers in this class are your audience, so you can and should use statistical terminology).

Your presentation should be structured as follows:

1. Title Slide: who did the research? Title of the study?
2. Introduce the Problem: what is the research question, and why is it interesting?
3. Research Methods (2-3 slides): how did you perform the survey? What were the survey questions? Be detailed, but don't just fill up space.
4. Data (1 slide): summarize the data you gathered in a simple, understandable way (perhaps a table).
5. Results (1-2 slides): present the results of the study. A graph or table that clearly answers the research question is a must.
6. Biases: what sampling biases might have distorted your study (and how do you suspect they distorted it). Could you have done anything better?
7. Conclusion: in words, what have you learned?
